

Full Stack Engineer (Intern+FTE)

Morphle Labs Inc.
Bangalore HQ

The Company

Morphle Labs is a YC-funded startup by IIT alumni building Medical Devices for cancer diagnostics. We are a team of 50+ highly-energetic folks based out of Bangalore.

We are aggressive about continuous improvements to our products & software-based workflow is often designed & sold as customizable components. We have achieved high growth so far in terms of revenue across India (market leader) + USA & a sparse customer base across Europe, Southeast Asia & Middle east.

Our Products

We design, manufacture & sell products that are highly scientific in nature.

Our products Morpholens & Hemolens offer fully digital diagnostics workflows for cancer biopsies & blood-related disorders across all geographies. Our products are unique inventions across physics, robotics, perfect software workflows & AI-driven assistive techniques, designed for doctors/labs & hospitals across the globe.

For a digital diagnosis process, we are offering a digital platform to Pathologists, Medical Institutions & Cancer Research Centers.

Check out more about the current products at www.morphlelabs.com

The Role

Responsible for leading research and development of control firmware for our robotic devices along with our web-based digital pathology viewer interface.

Adding to the challenge is the fact that your interfaces will be used by a diverse group of users consisting of AI engineers, data scientists, lab technicians, and medical professionals. Have previously led the development of complex web-based software and are looking for the next big challenge, then this is the profile for you.

We have a strong engineering culture with a focus on

- 2D Map-based imaging platform for visualization of pyramidal images and integrated deep learning algorithms. (check out <https://morphlelabs.com> for examples).
- Modular Web-API-based architecture Built with Django and React.js .
- Low-Level Speed Optimised Scanner Software Built with Java, C, and C++.
- Robust Image Processing pipeline to deliver the best image quality.
- Building Image Based Machine Learning Algorithms with the highest level of accuracy, sensitivity, and specificity to create the most value for healthcare.

In addition to the right technical skills, we stress on right engineering mindset that outweighs knowledge when solving the new-new problems

- Patience to dive deep and Grasping power to digest complex system design (a must-have for building stuff from scratch).
- Tactical debugging when dealing with not-so-trivial and often opaque frameworks.
- Pattern-based thinking enables one to derive new frameworks for high-quality code.

Ideal Candidate

- Bachelor, Master or Ph. D. in Computer Science, Engineering, or a related technical discipline.
- Strong algorithmic and problem-solving skills.
- Experience with various stages of development right from the idea stage to prototype to a polished product.

If you enjoy helping others AND diving into novel scientific products, you will truly enjoy the journey and learn about life in the process :)

Uniquely Lovable about the opportunity

- A young team that works hard & parties harder!
- Amazing in-house cook ensuring hot food & continuous flow of tea/coffee on the house.
- Opportunity to significantly contribute towards improving cancer diagnostics across the globe. Our users (Doctors) truly love us & it's immensely satisfying to be part of the value chain that saves lives.
- We offer above-market average base salaries & only hire exceptional talent.
